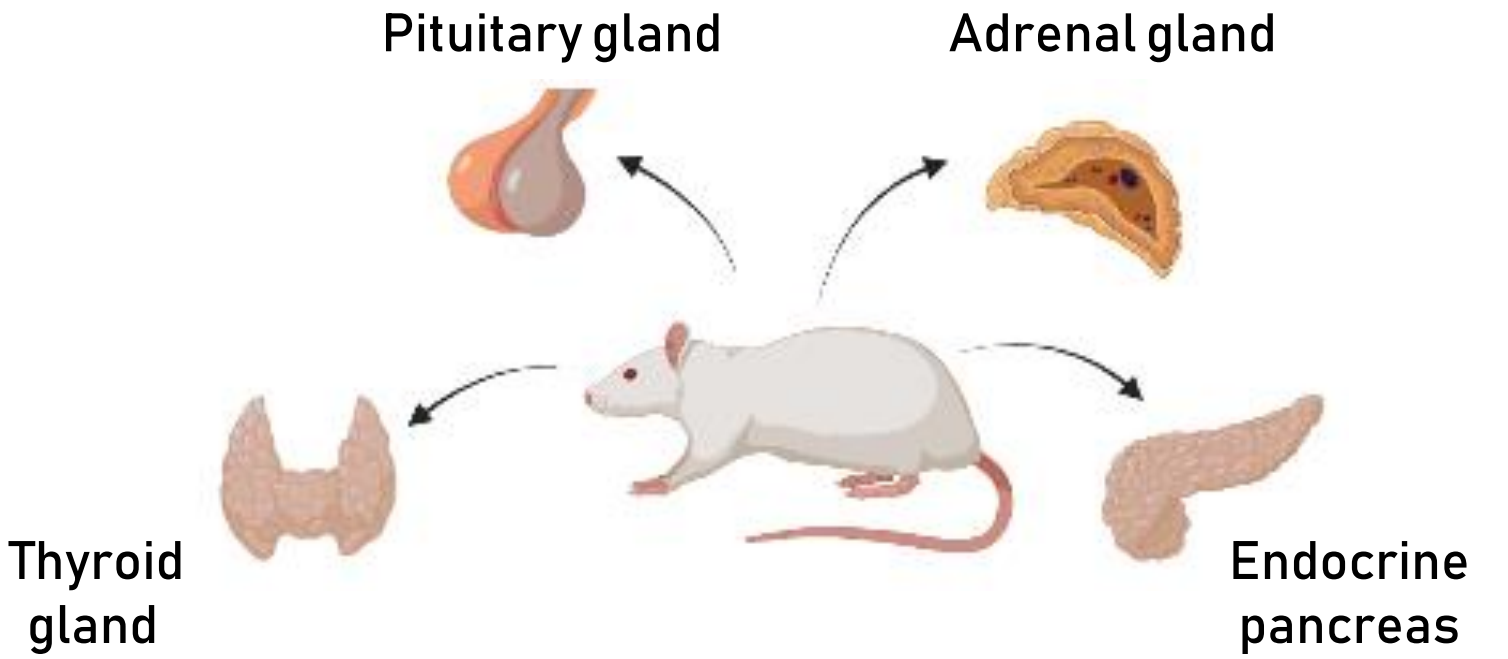
MENX rats: a model of multiple NETs

phenotype

- Multi-tumor syndrome that spontaneously developed in a rat strain
- MENX affected rats have a loss-of-function mutation in p27
- Pituitary and adrenal tumors develop in 100% of rats by 7-8 months (progression)



Clinical issues to solve for NETs

- Based on the new WHO classification from 2017, all NETs have the potential to become malignant and therefore incurable.

1st question:

how can we predict which tumor will become malignant?

→ New biomarkers

2nd question:

which treatments can work for unresectable/aggressive tumors?

→ New therapeutic targets/therapies

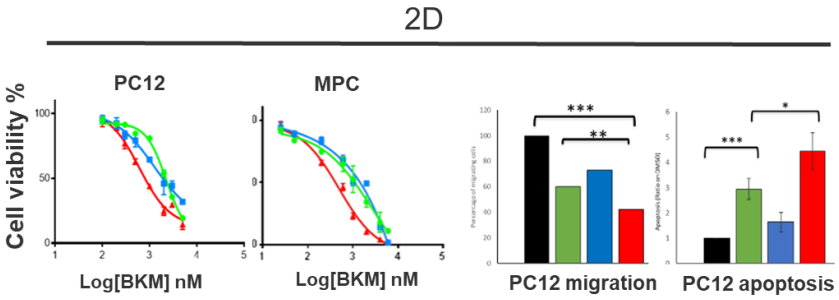
Mohr et al. Cancers 2021; 13:126

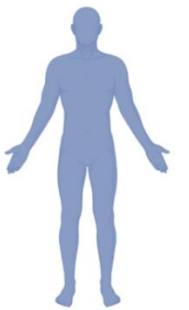
Targeting PI3K and CDK4/6 as effective therapeutic option for PCCs

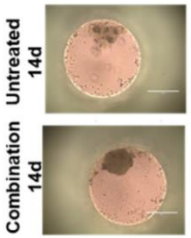
In vitro:

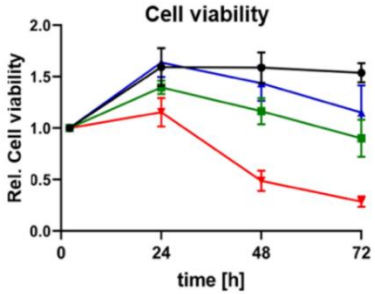
PCC cell lines (2D and 3D)

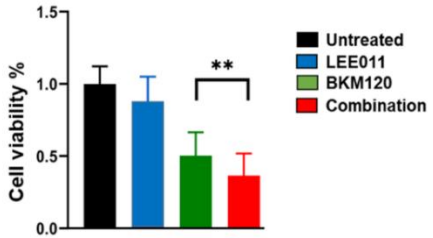


Primary PCC cultures (3D)



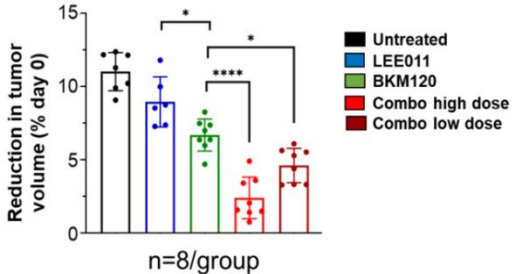






In vivo:

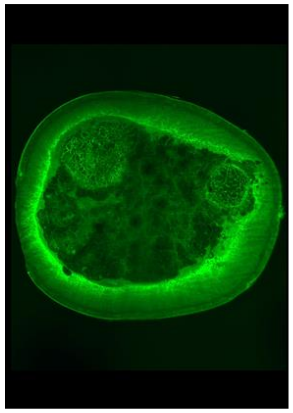
Xenografts of PC12 cells



Manuscript in preparation

Imaging MENX pheochromocytoma (PCC)

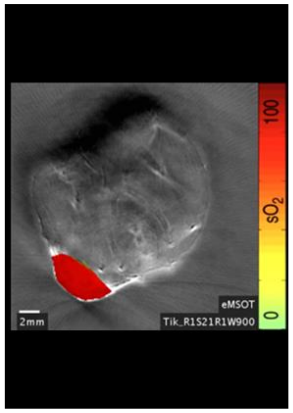
LSM



Advantages:
- Very high resolution
- Immunostaining possible

Disadvantages:
- Only one timepoint

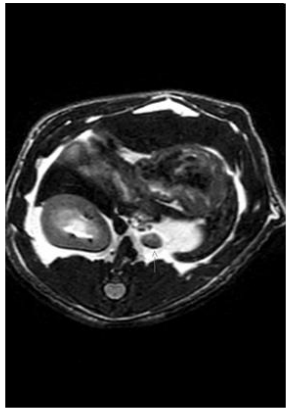
MSOT



Advantages:
- Oxygen saturation
- Compatibility with contrast agents and fluorophores
- Detection of difficult tissue as fat & blood

Disadvantages:
- Limited tissue penetration

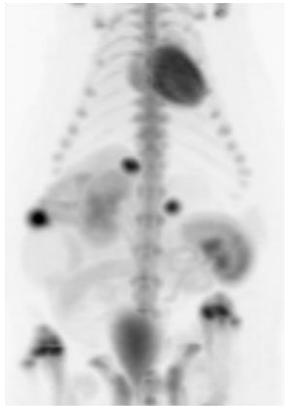
MRI



Advantages:
- High spatial resolution
- No tissue penetrating limit

Disadvantages:
- Relatively low sensitivity
- High cost
- Long imaging time

PET



Advantages:
- High sensitivity
- No tissue penetrating limit
- Quantitative
- Whole-body scanning

Disadvantages:
- Radiation risk
- High cost

PET/CT

Advantages:
- High sensitivity
- Combination of anatomical and functional images
- Quantitative
- Whole-body scanning

Disadvantages:
- Radiation risk
- High cost

Clinical issues to solve

Nonfunctioning pituitary tumors

- Often invasive→ they cannot be removed by surgery→ recur
- Don‘t respond to standard therapies with somatostatin analogs

→ New therapeutic targets/therapies

Head-to-head comparison of octreotide LAR (sandostatin) and pasireotide LAR (signifor) for efficacy against pituitary tumors (PTs)

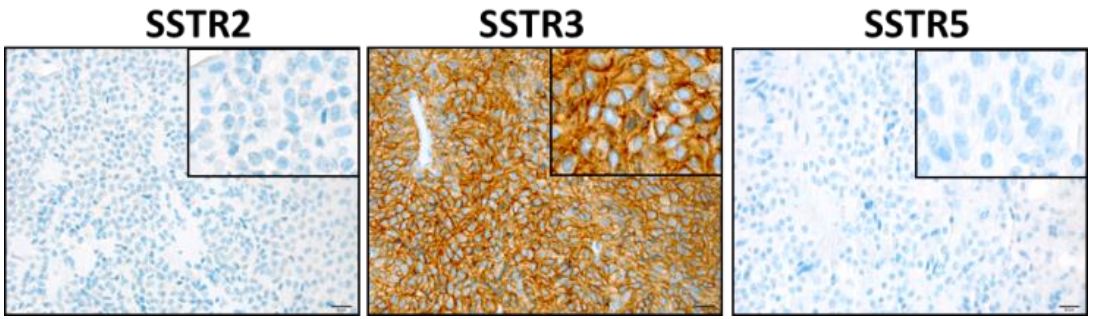
Mathias Schillmaier, Franz Schilling, Johannes Notni, Katja Steiger

Clinical issues to solve

Nonfunctioning pituitary tumors

- Often invasive→ they cannot be removed by surgery→ recur
- Don‘t respond to standard therapies with somatostatin analogs (SSTR2-directed)

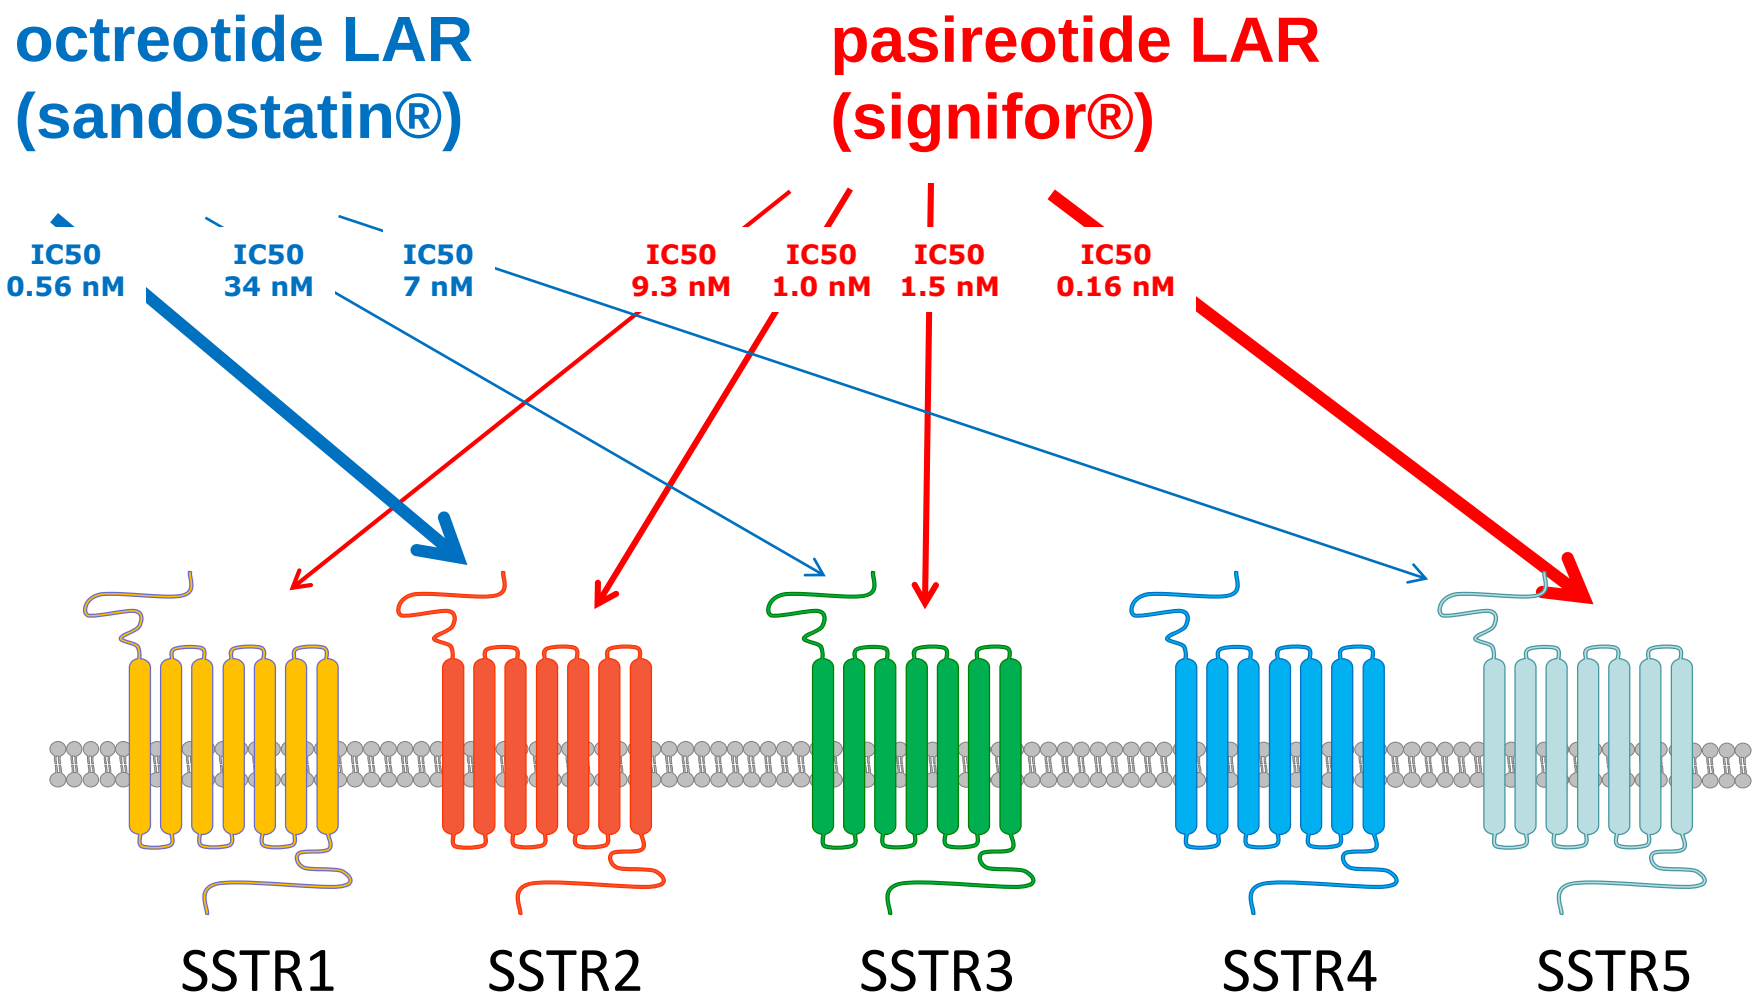
→ New therapeutic targets/therapies



Human NFPTs

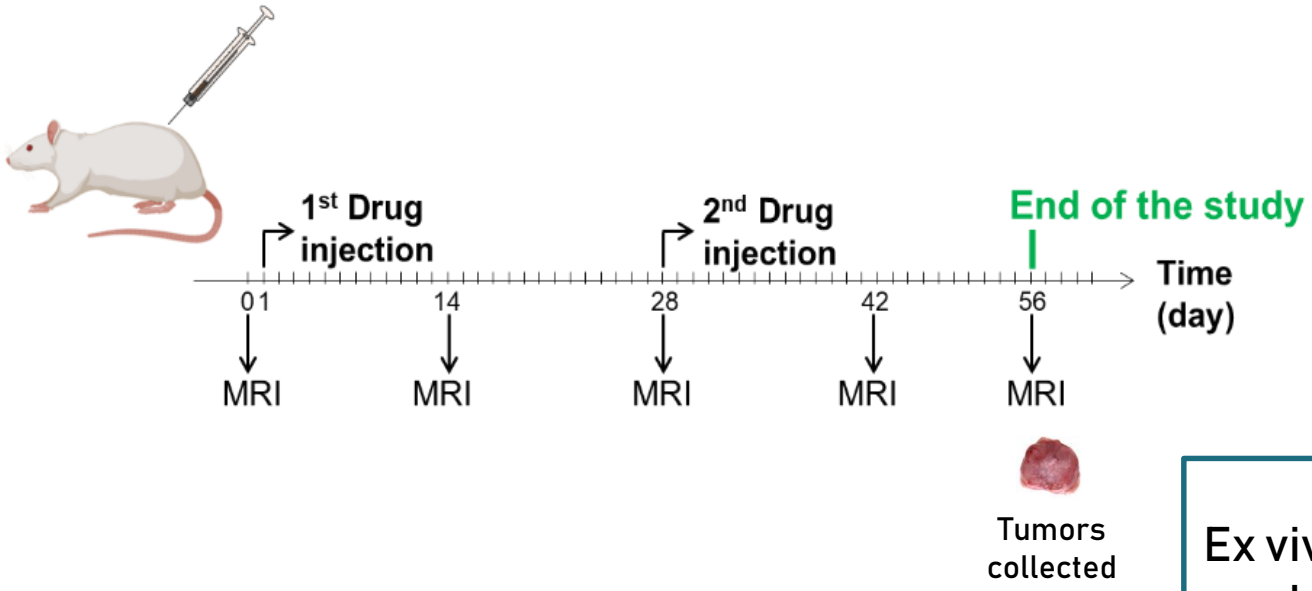
Lee et al. Endocr Related Cancer 2014

Somatostatin analogs and their affinities for somatostatin receptors (SSTRs)



Is pasireotide more effective than octreotide in our model of NFPTs?

Group 1: Mut/mut placebo-treated (control)
Group 2: Mut/mut + sandostatin® (octreotide) [1X/2x 28d]
Group 3: Mut/mut + signifor® (pasireotide) [1X/2x 28d]

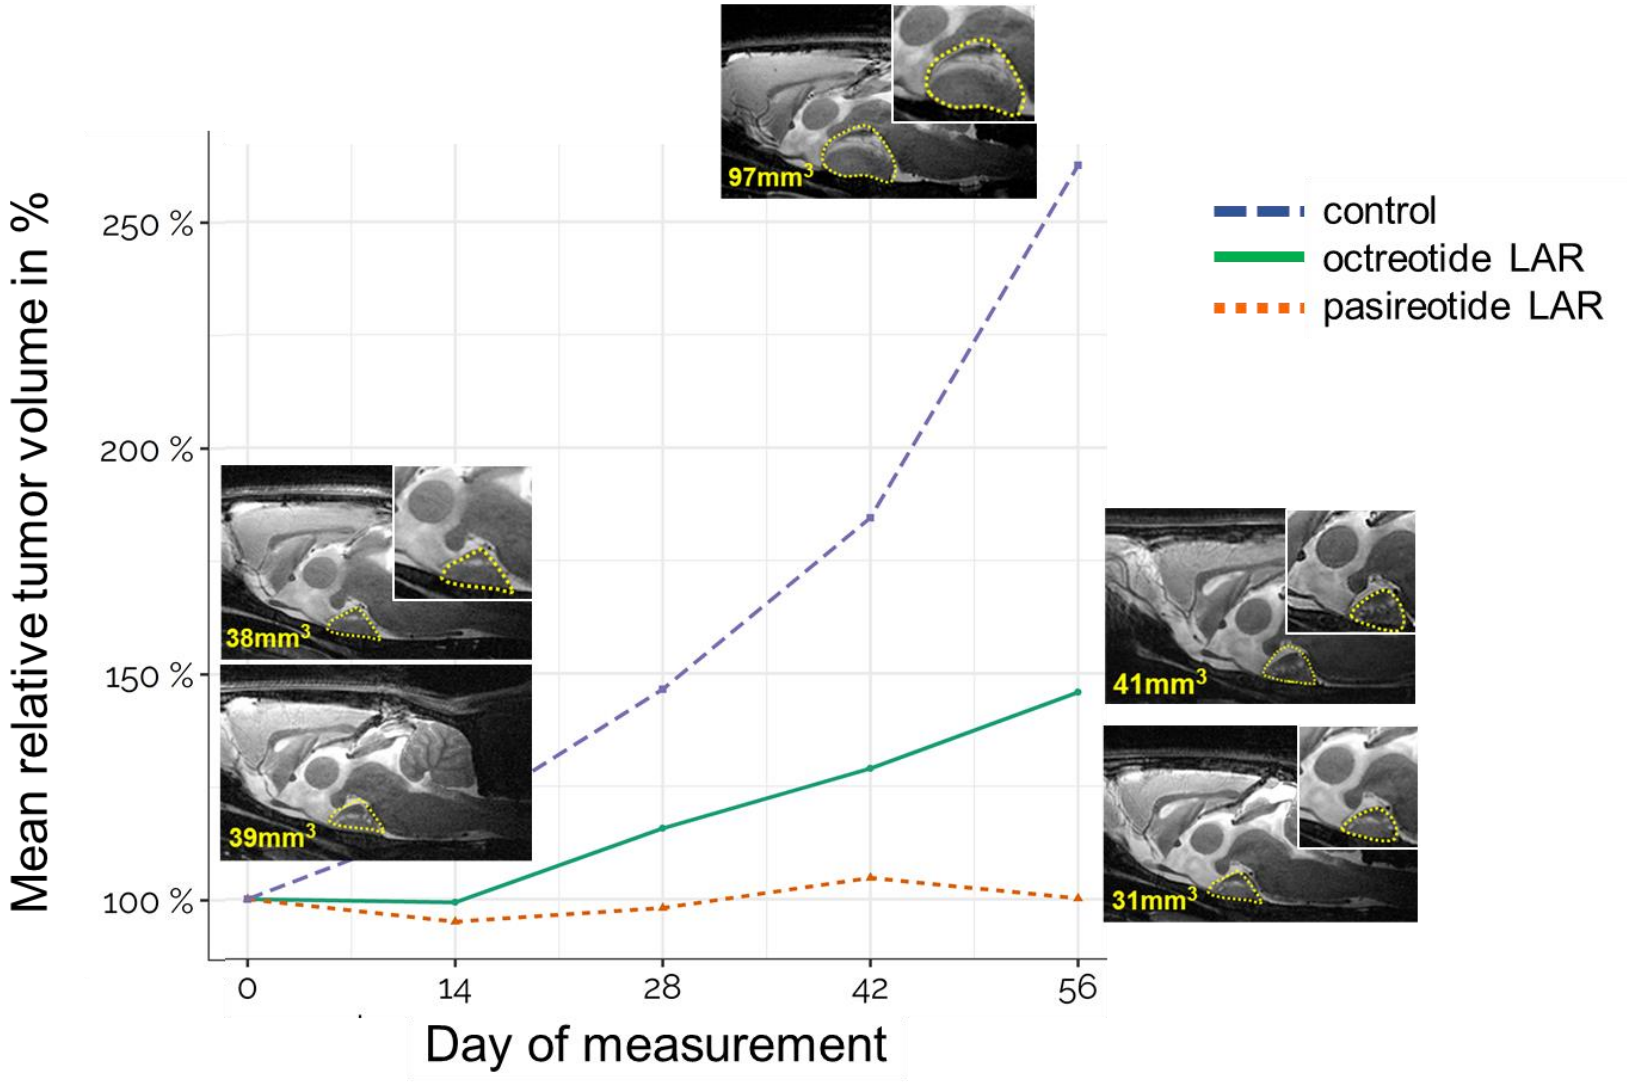


Ex vivo readouts → Ki67, Apoptosis, Sstr expression

Octreotide LAR (sandostatin)
Pasireotide LAR (signifor)
] Novartis Pharma

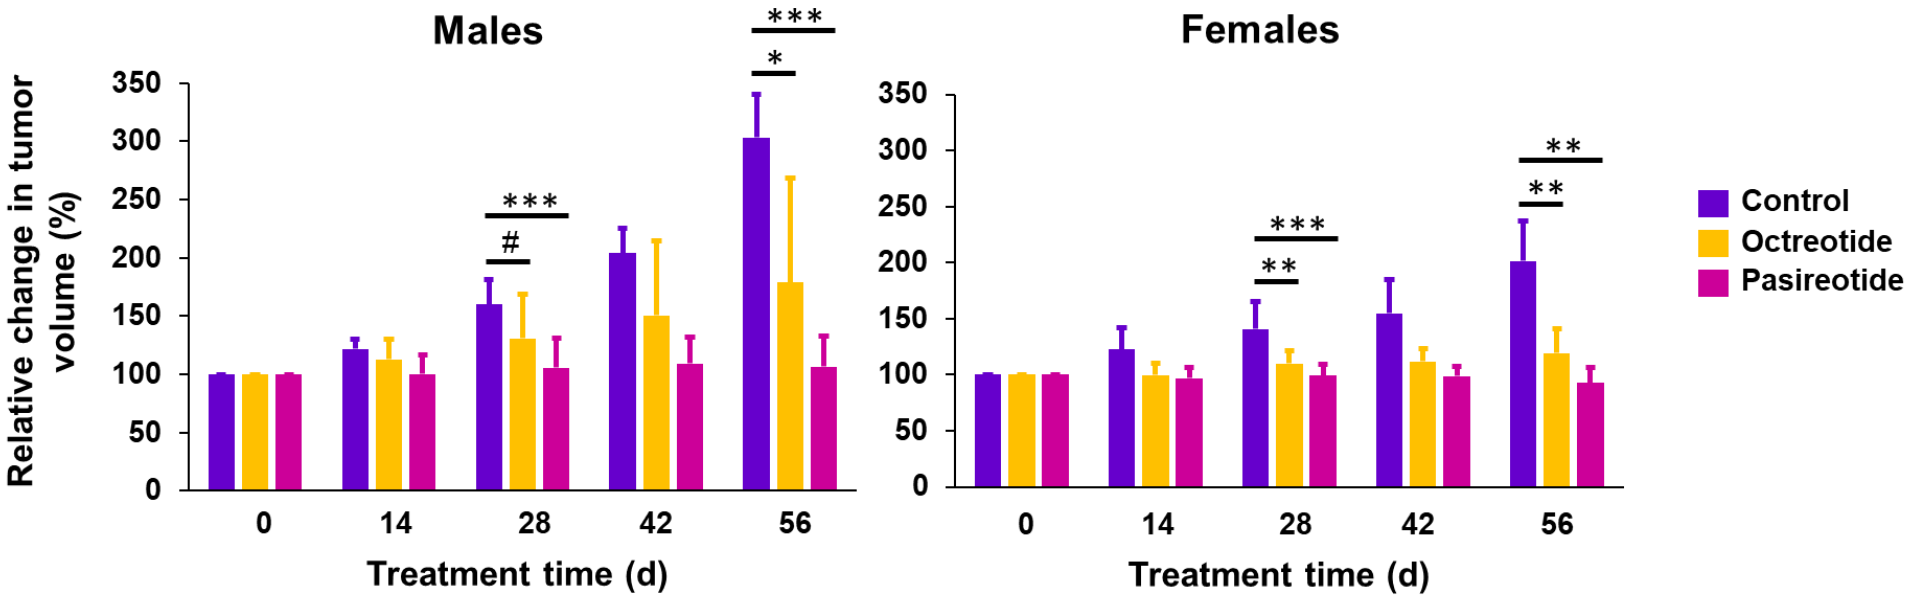
Gulde S et al. Cancers 2021 epub 22.06.2021

Inhibition of tumor growth: pasireotide > octreotide; females > males

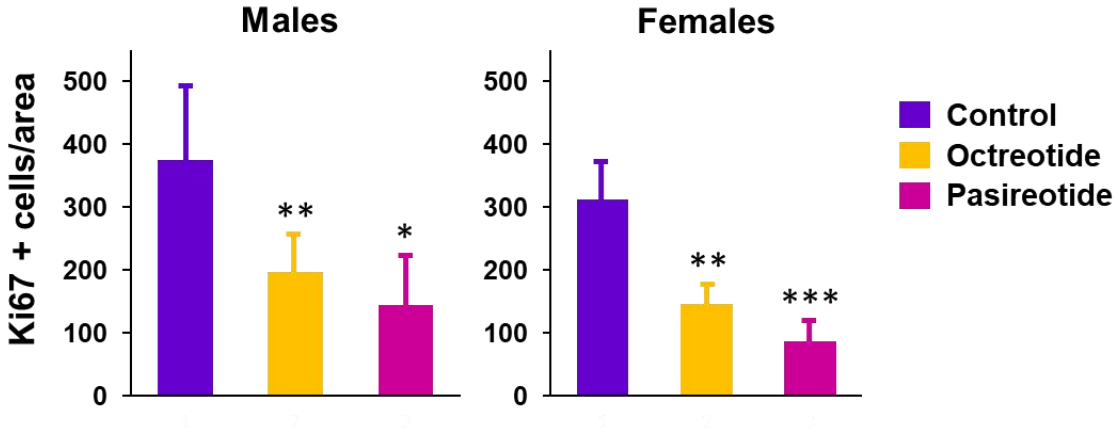


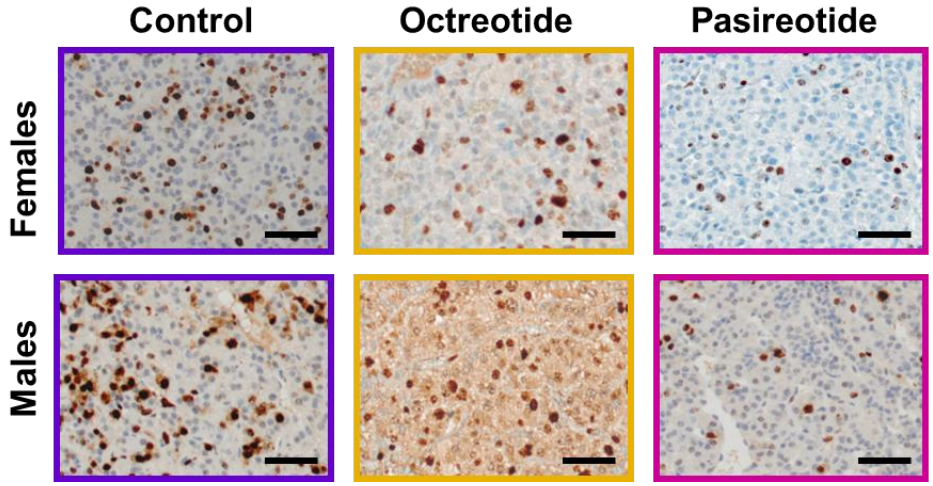
Inhibition of tumor growth: pasireotide > octreotide

Gender effect



Inhibition of tumor growth *in vivo* correlates with Ki67 labelling index *ex vivo* (for pasireotide < than for octreotide)

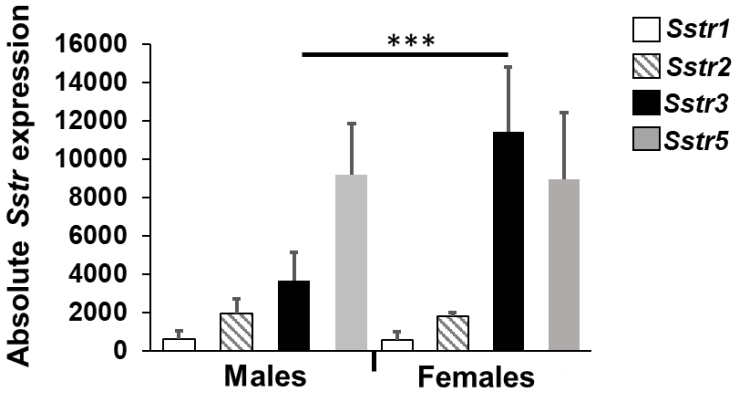




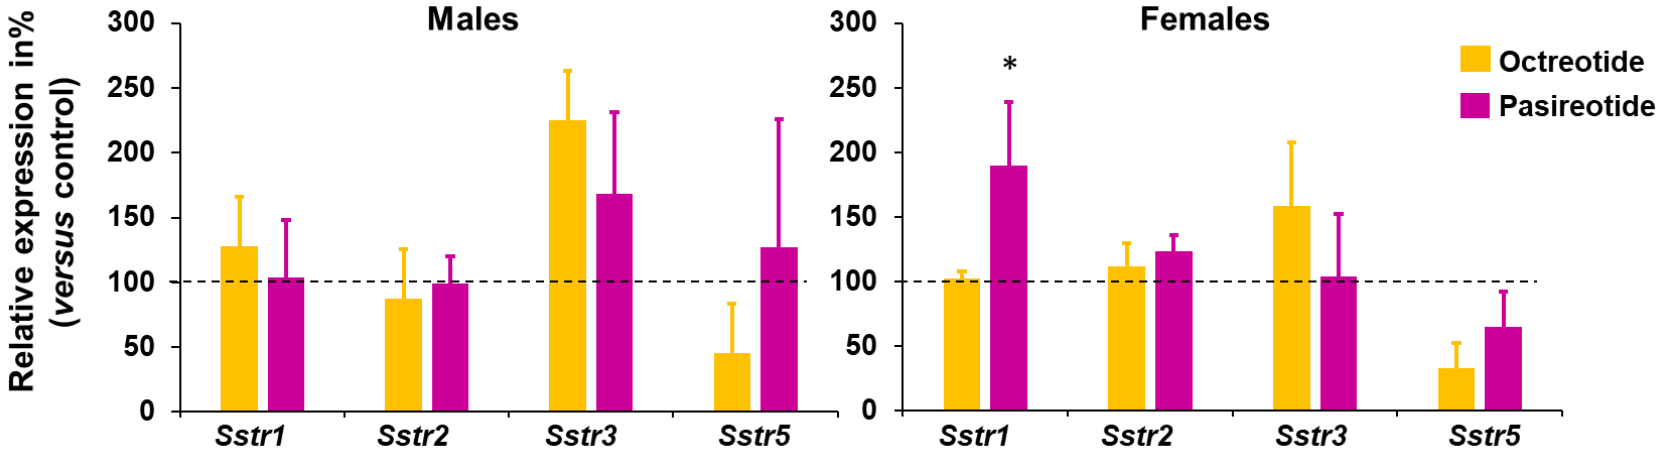
Ki67 immunohistochemistry

Expression of Sstr genes in PTs @ baseline and after treatment

Females have higher *Sstr3* expression at baseline

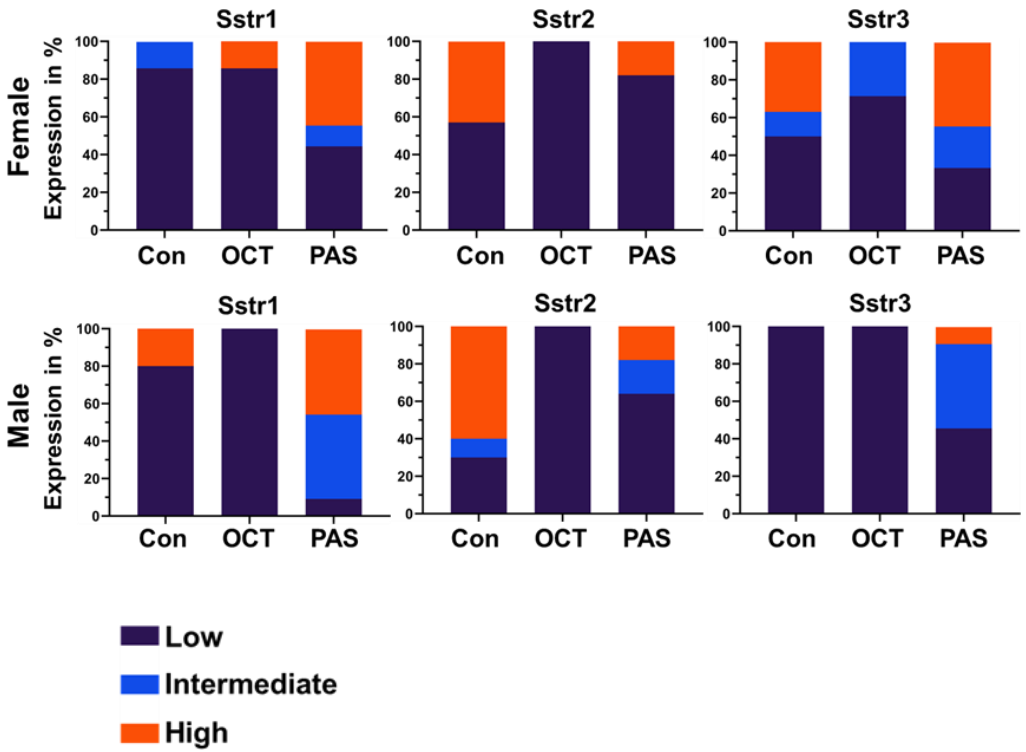


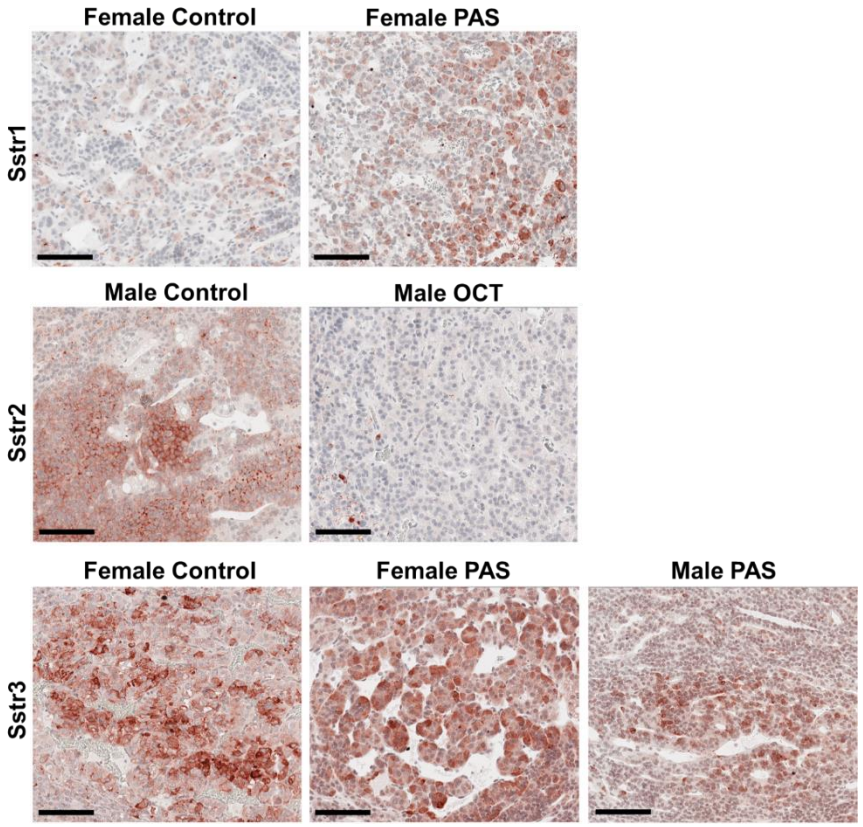
Following treatment



Is the expression of Sstr 1,2,3 receptors modulated by the drugs?

Octreotide reduces Sstr2 protein expression; pasireotide increases Sstr3 expression in males

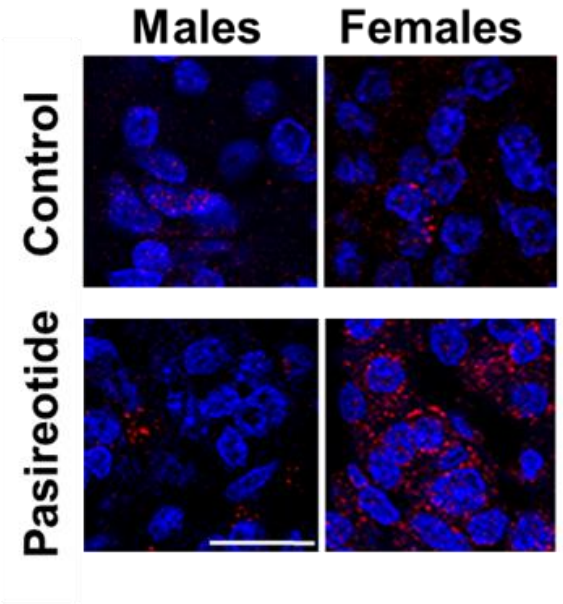


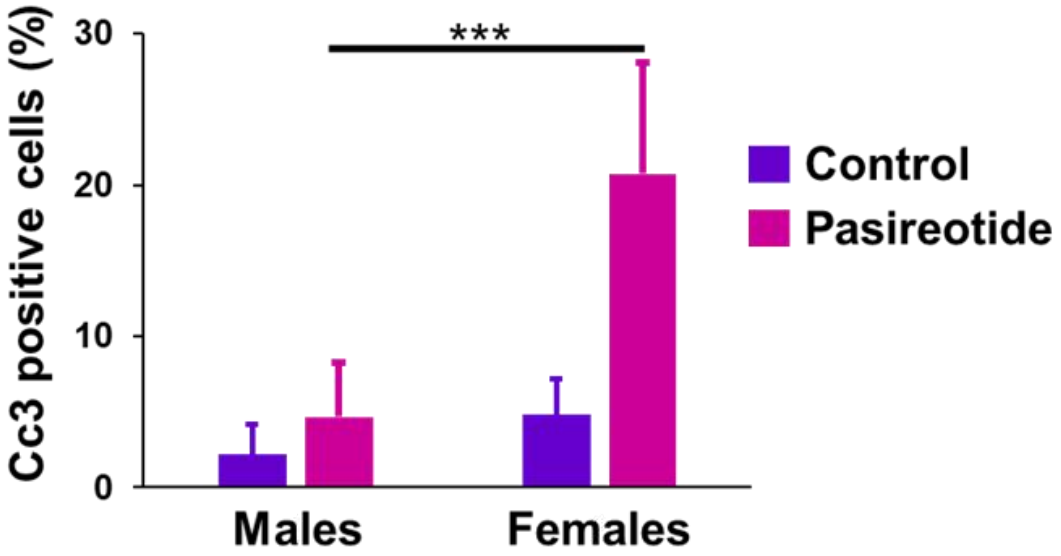


Coll. A. Lupp, S. Schulz (Uni Jena)

Apoptosis as the cause of shrinkage upon pasireotide treatment?

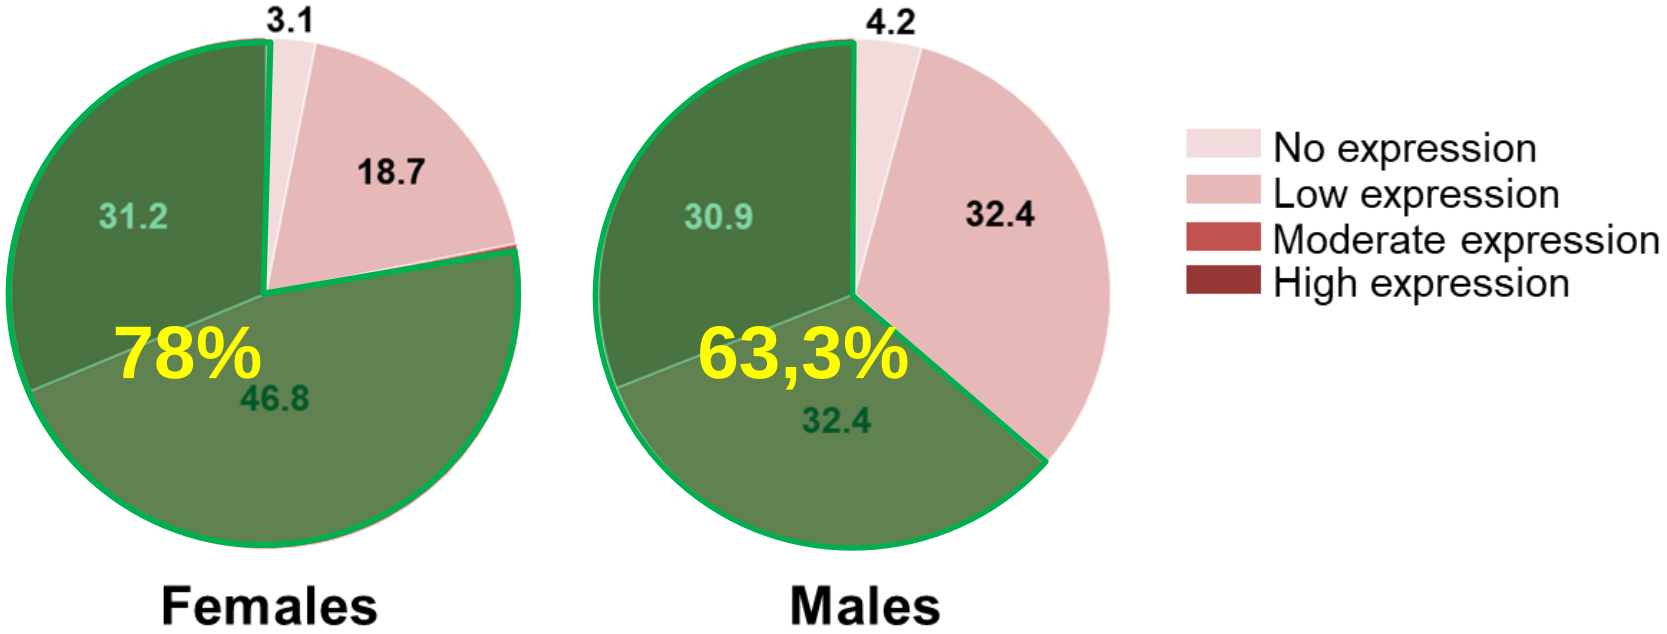
In females there is induction of apoptosis upon pasireotide treatment





Expression of SSTR3 in human NFPT patients (n=108)

In female patients there is a trend for higher SSTR3 expression (patient stratification?)



Gulde S et al. Cancers 2021 epub 22.06.2021

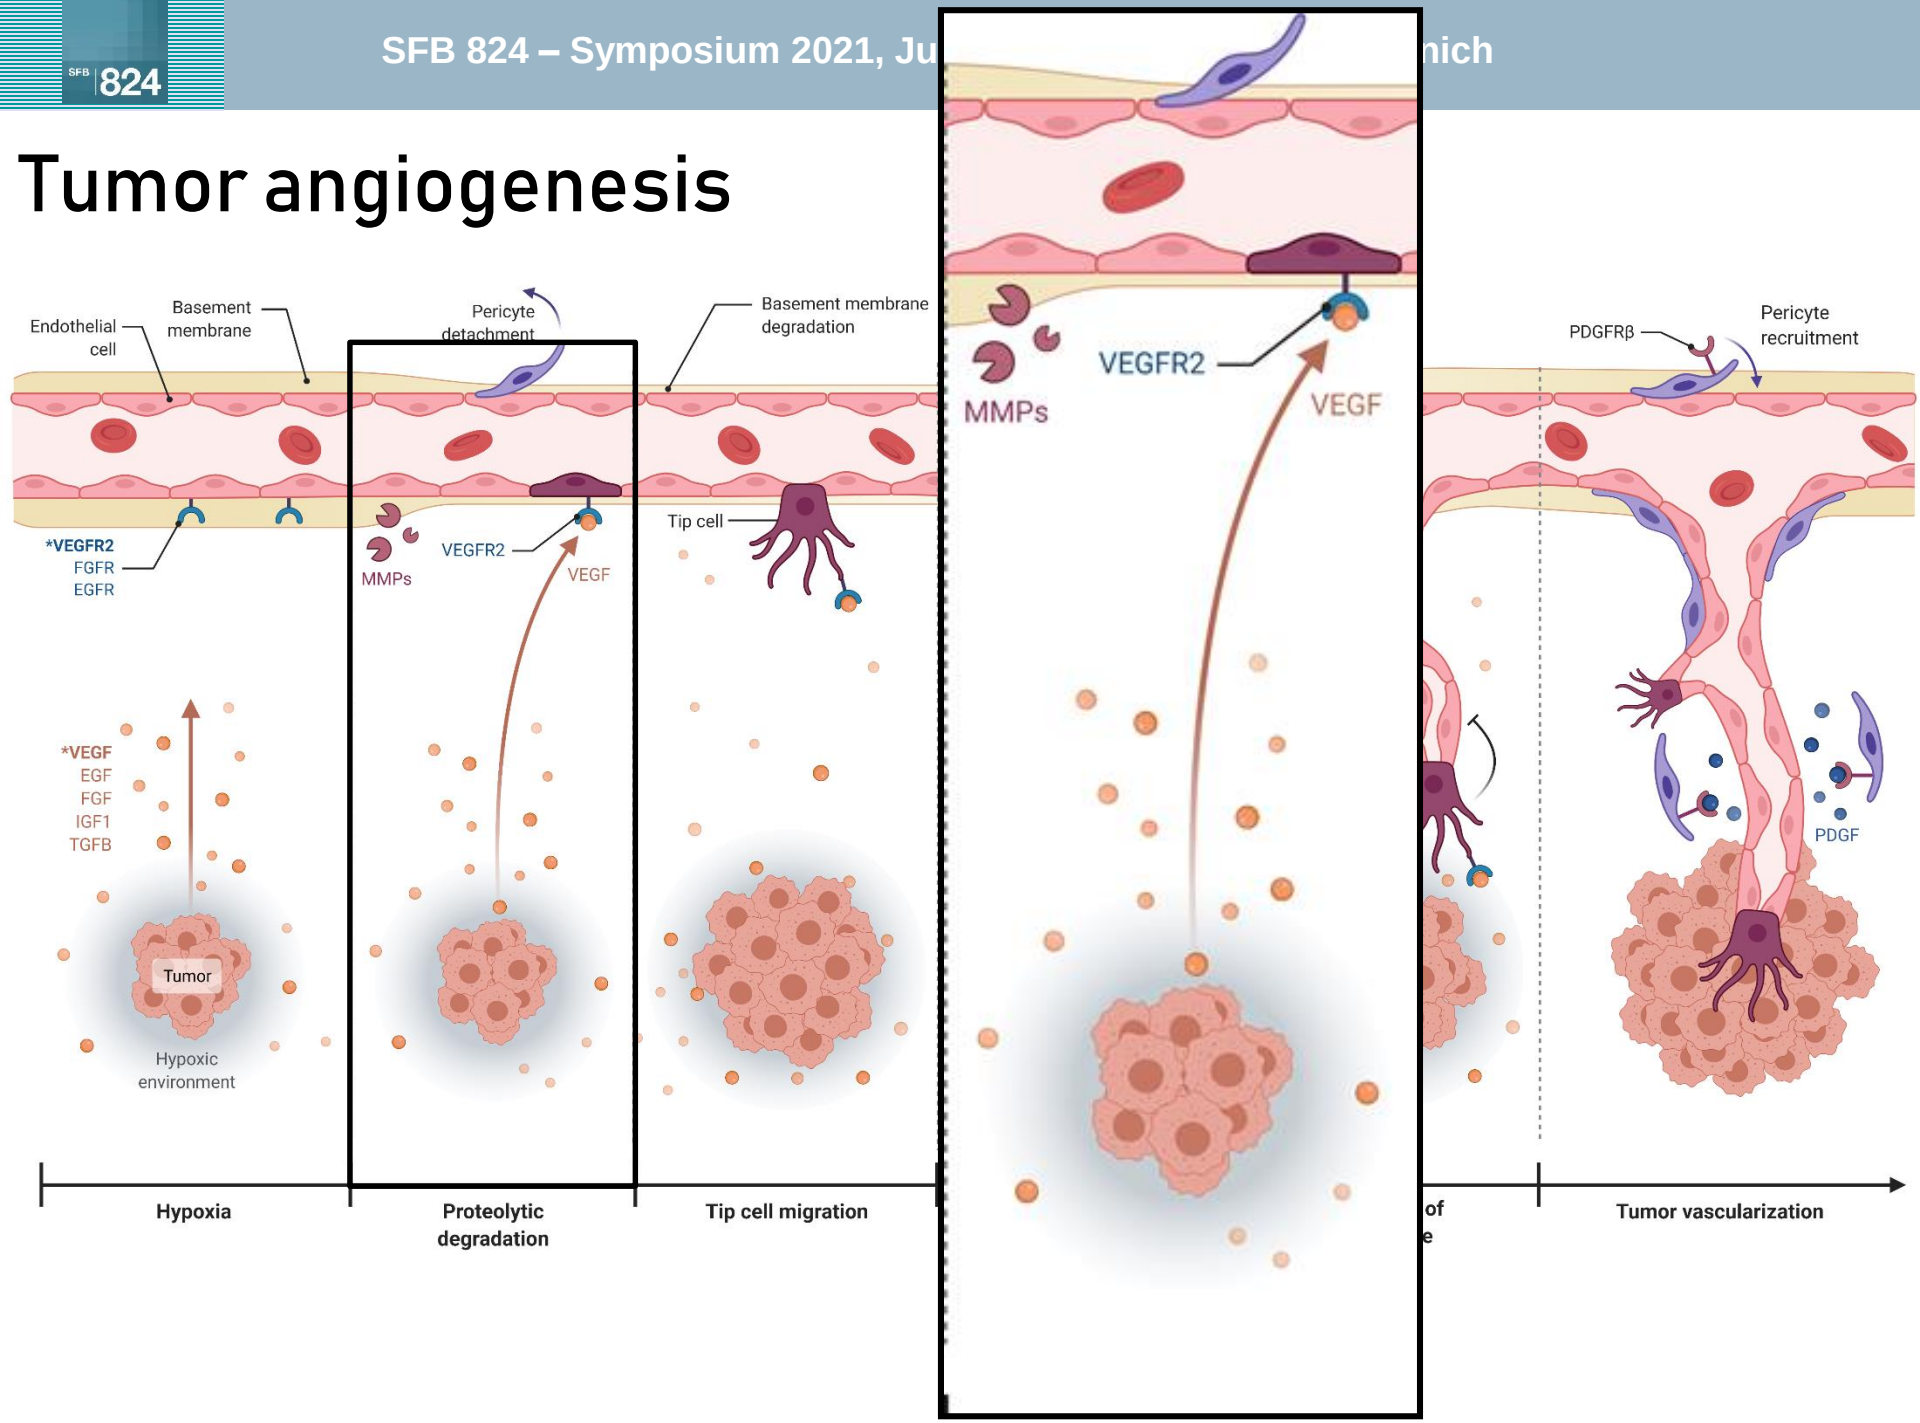
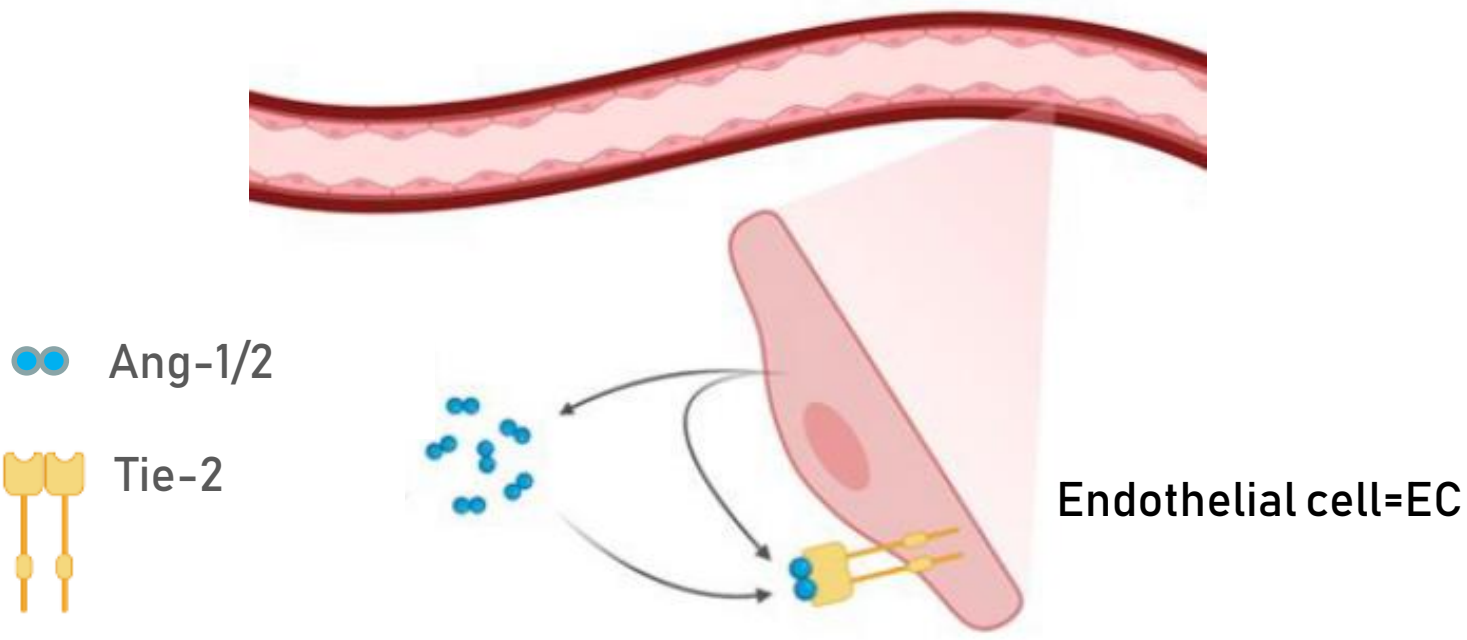
Tumor angiogenesis



Angiopoietins and Tie-2 receptor

promote survival and proliferation of ECs

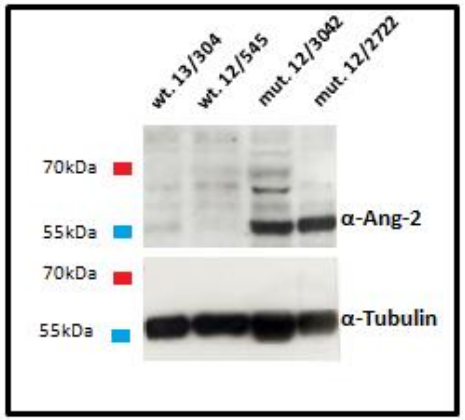


Autocrine signaling

Signature of rat pituitary tumors (PTs)

- Among the genes dysregulated in rat PTs are angiogenic genes: Angiopoietin (Ang)-2 (+2,4 fold) and Ang-1 (-3,4 fold) *versus* normal pituitary

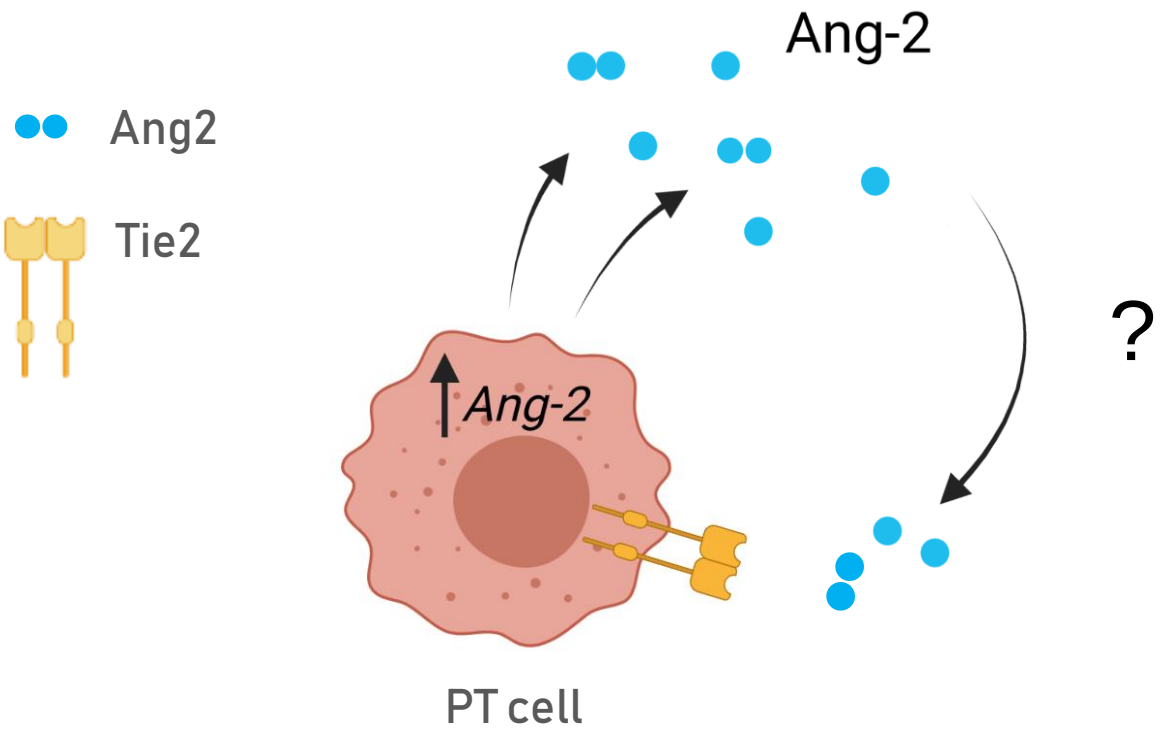
	Age	Ang-2	Angptl2	Vegf
wild-type n=3 (the average is used)	7-8 mo	0,81	0,58	0,75
12/1189 mutant	8.5 mo	5,18	2,40	3,25
12/1791 mutant	8.5 mo	1,89	0,70	1,46
12/1792 mutant	8.5 mo	1,64	0,47	1,63
12/3037 mutant	7 mo	1,00	0,46	0,85
11/447 mutant	9 mo	2,47	1,14	2,10
11/370 mutant	9.5 mo	1,56	2,25	1,78
11/1633 mutant	8 mo	2,14	0,44	1,75



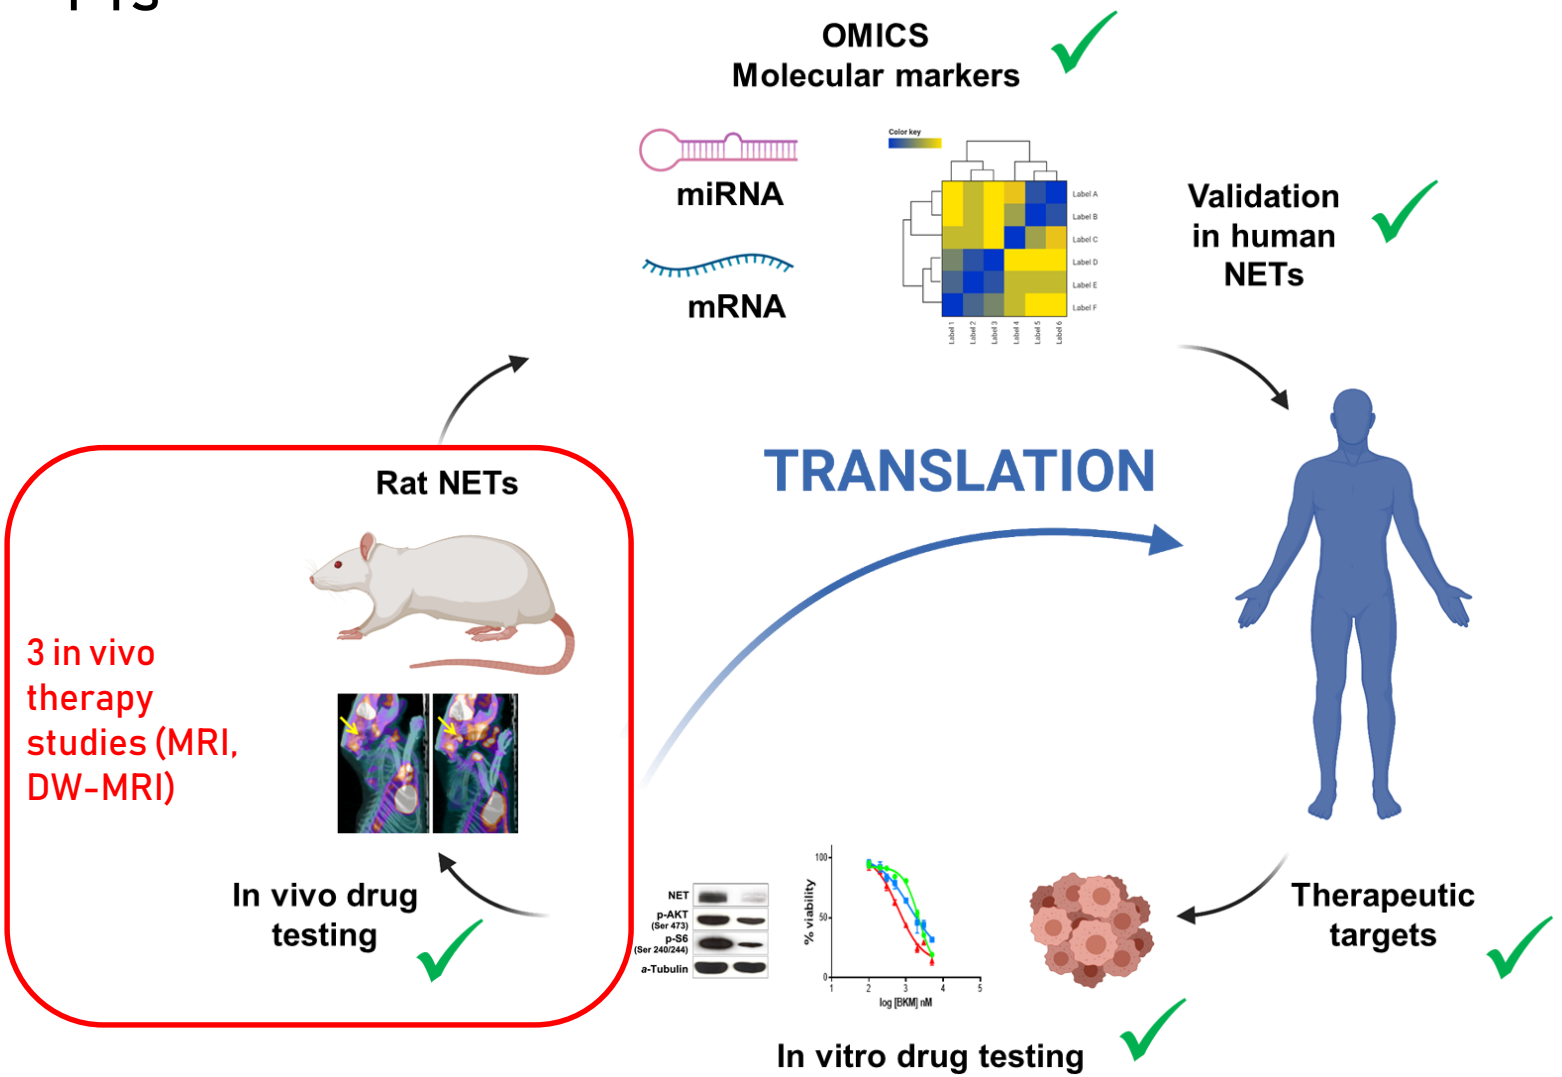
Situation in PT cells:

- High expression of Ang-2 (which is secreted)
- Expression of Tie-2

autocrine stimulatory loop as in ECs?



- Ang/Tie-2 signaling in PT cells supports cell viability in vitro and in vivo and represents a therapeutic target for recurrent/aggressive PTs



A new pathway active in PT cells that mediates the cross-talk between tumor and endothelial cells → target for therapy
